Overview

This project shows an example of an RDMS. This project showcases a Netflix movie database showcasing movies, shows, directors, actors, etc.

To use this database, run up an instance of the database, everything is provided with the database CSV folder.

If data is not populated in the database, please run the commands that copy over the CSV files.

After the files are in there, run the myTool python file. From there, you will be able to manipulate the database. While running an operation, specify the database manipulate, enter the relavent data, and submit it. The database has error handling, so if you make a mistake, it will catch it and allow you to continue or end the process.
